ABSTRACT

Physical keys are the most natural way to lock or open a door, and everyone is familiar with it. Although the physical key is a well-proven and well-known technology, it is not without faults. For a lock, there can only be one unique key. Different keys are required for various locks. Carrying a big number of keys is also inconvenient. Smart locks are key-less door locks that let you unlock your door without having to use a real key. A smart lock is an electromagnetically lock that is meant to lock and unlock a door when it receives instructions from an authorized device and executes the authorization procedure using a cryptographic key.

DECLARATION

We hereby declare that the project entitled “**DIGITAL KEYPAD SECURITY DOOR LOCK**” submitted in partial fulfillment by us for the degree B.Sc. Engineering in Computer Science and Engineering in the faculty of Computer Science and Engineering of **Bangladesh University of Business and Technology (BUBT)** under the guidance of our supervision of **Fahima Khanam**, Lecturer, department of Computer Science and Engineering is our own work and it contains no material which has been accepted for the award to the candidates of any other disciplines except few references which is taken from various books and authors to enrich our knowledge about the topic of our project.

Project Supervisor

Fahima Khanam

Lecturer

Department of CSE,

Bangladesh University of Business and Technology (BUBT).

Mirpur-2, Dhaka-1216.

DEDICATION

Dedicated to our parents for all their love and inspiration.

ACKNOWLEDGEMENT

“Task successful” makes everyone happy. But the happiness will be gold without glitter if we didn’t state the persons who have supported us to make it a success. Success will be crowned to people who made it a reality but the people whose constant guidance and encouragement made it possible will be crowned first on the eve of success.

This acknowledgment transcends the reality of formality when we would like to express deep gratitude and respect to all those people behind the screen who guided, inspired and helped me for the completion of our project work. We consider ourselves lucky enough to get such a good project. This project would add as an asset to our academic profile.

We express our gratitude to the help of our supervisor **Fahima Khanam**, for his constant supervision, guidance and co-operation throughout the project and for giving constant motivation and valuable help through the project work. We also would like to thanks to our honorable chairman **Md. Saifur Rahman**, for his support and giving us support and giving us permission to use the computer lab whenever we needed.

We extend our sincere gratitude to our parents who have encouraged us with their blessings to do this project successfully. Finally we would like to thank to all our friends, all the teaching and non-teaching staff members of the CSE Department, for all the timely help, ideas and encouragement which helped throughout in the completion of project.

APPROVAL

This project “**DIGITAL KEYPAD SECURITY DOOR LOCK**” submitted by Md. Firose Mahmud, Fariha Islam, Md. Ridoy Babu, Md. Habibur Rahman Shohel, Md. Arafat Hossan and Sadia Akhter ID No. 19201103003, 19201103008, 19201103018, 19201103027, 19201103039 and 19201103131 students of B.Sc. in Computer Science and Engineering from Bangladesh University of Business and Technology in the year November, 2020 under the supervision of Fahima Khanam, Lecturer, Department of Computer Science and Engineering has been accepted as satisfactory for the partial fulfillment for the requirements of B.Sc. in Computer Science and Engineering and approved as to its style and contents.

Chapter – 1 (Introduction)

1.1 Background of Study and Motivation:

In our daily lives, safety is a major concern. Every person requires a sense of safety. Our security pattern includes an access control system for doors. Traditional locks are no longer as secure as they once were; anyone can gain access by breaking these locks. We need to create a system that will assist 24 hours a day, seven days a week. Only authorized individuals have access to restricted areas thanks to a password-based door lock system. Arduino is in charge of the entire system. A keypad can be used to enter the password. The door opens if the password matches the password entered in Arduino. This password-based bolt structure will provide clients with a more secure and low-effort locking-opening mechanism. Mechanical door locks will be replaced by electronic door locks in the future, thanks to the security door lock automation system.

1.2 Project Objectives:

The goal of this project is to research and analyze a suitable collection of components for developing a smart door lock using Arduino that provides excellent security and quick access. The following are the specific project goals:

- Familiarity with a smart door locking system based on a microcontroller.
- Using Arduino to create a simple and smart door locking system.

1.3 A brief outline of the report:

This project is divided into 5 chapters. **Chapter 1** present the background of study and motivation of this project. Chapter one also presents objectives and a brief outline. **Chapter 2** provides the literature review of this project. **Chapter 3** introduces the project methodology and modeling like working principle, process of work, component, implementation, testing and cost analysis. **Chapter 4** presents the results and discussions of this project, also the simulation and experimental results. Finally, **Chapter 5** Conclude the project.

Chapter – 2 (Literature Review)

2.1 Introduction:

There are just a few digital approaches for door security locks in the current system. This contemporary smart locking system takes the place of the classic lock and key locking method. Modern living is largely reliant on technological advancements, such as opening doors, managing the air conditioning, and regulating the curtains. People want to feel safe in their own homes, offices, and stores. The primary motivation for the development of smart locks is to meet the needs of people. Some of these systems will be discussed in this section.

2.2 Fingerprint Locking System:

A fingerprint locking system is a locking system that uses a fingerprint sensor module to secure the user's fingerprint. The fingerprint sensor module uses an Arduino or a Raspberry Pi to operate. In the proposed system, there is three-level security. Any two levels of security users have to face to unlock the system. This is the ideal option for avoiding the hassles of a stolen or lost key or illegal access. The authorized user must register his or her fingerprint in the system. The registered person's mobile number is then added to GSM, and a permanent image password is assigned to this user. As a first step, the unauthorized individual must choose unauthorized as the user type. The admin receives a random picture. The person must properly choose the random image. Otherwise, the system will go back to the first page.

2.3 Internet of Things:

The internet of things, or IoT, is a wireless link that works in a door lock. With the help of IoT-enabled applications, the user may unlock the door with his smartphone. The servo library is introduced after the application is developed by creating a string variable that contains the unique device ID for the lock. The essential concept underlying the door lock's operation is the ID supplied by the Android phone via the created app.

2.4 Knock-Pattern Using Arduino and GSM Communication:

This system, which consists of Arduino, GSM Module, Servo Motor, and other components, employs a 'Secret Knocking Pattern' that is only known by the owner of the safe, luggage, or other property or item on which the device is mounted. For the lock to open, the knocking pattern must be used only at a certain location, which is only known by the owner. The secret pattern can only be changed after the secret knock has been unlocked. Because there is no key to be copied, this approach fully eliminates the worry of duplication.

2.5 Keyless Entry System Based on Arduino Board with Wi-Fi Technology:

A keyless entry system that focuses on the use of an Arduino circuit board, a Wi-Fi module, and the PHP programming language to provide access to a closed door. The suggested solution, which uses an Arduino Uno board and a Wi-Fi shield to unlock the door without a key, is described. The internet connection allows the system to unlock the door from any place, unlike traditional systems, which have a limited range.

2.6 RFID Based Access Control System

A magnetic door lock is administered through an RFID reader in the suggested system, which begins the authentication and validation of the

user or regulates access in short. In addition, the systems keep track of each user's access and exit records in the form of a log report for each access. To avoid unforeseen circumstances, the administrator of the central subsystem can terminate the validity of any user at any moment.

Chapter - 3 (Methodology and Modeling)

3.1 Introduction:

In this project, we implemented a Password-Based Security System Using Arduino & Keypad. As thefts are increasing day by day security is becoming a major concern nowadays. So a digital code lock can secure our home or locker easily. It will open your door only when the right password is entered. Only authorized people are allowed access to the restricted sections due to a password-based door lock mechanism. The Arduino is responsible for the entire project's operation. The desired password can be entered using a 4×4 keypad.

3.2 Working Principle:

Process of Work:

The purpose of this experiment is to implement a door-locking mechanism that opens or closes the lock on the door automatically with a key code. There are some work processes for this experiment which are:

Case 1: Welcome message:

When the 5 volt Power given, the welcome message print in the display. In the first line print the string **“WELCOME TO BUBT”** and in second line print the string **“Loading.....”**. Then **“Enter Password”** shown.

Case 2: The lock will open:

A Keypad will input values allowing us to compare the values with the string of integer values that are set in the code. When inputting a code comprising of integer values with the help of the Keypad, if the string of integer values matches the string of integer values already fixed in the code, the keypad will send a signal to the display and the **“Door is Open”** message will be shown. If the code is accepted, the Arduino will send a signal to Servo Motor. The Motor will then rotate 90° and open the lock, allowing the door to be unlocked.

Case 3: Auto Lock:

When door is open, after few seconds door is auto lock by printing message **“Time is up”**.

Case 4: The lock will not open:

If the code inserted in the Keypad does not match the fixed string in the code, the Keypad will send a signal to the Display to show the **“Wrong Password”** message. Pressing the wrong values in the Keypad will automatically instruct the user to start again from the beginning. If the **“Wrong Password”** message is shown, the Servo Motor will not rotate and the lock will not open allowing the door to remain locked.

3.3 Important Components:

Hardware:

- Arduino UNO
- 4×4 Matrix Keypad
- Servo Motor
- 16×2 LCD Display

Software:

- Arduino IDE

3.3.1 Arduino UNO:

Arduino is an open-source platform used for building electronics projects. Arduino consists of both a physical programmable circuit board (often referred to as a microcontroller) and a piece of software, or IDE (Integrated Development Environment) that runs on your computer, used to write and upload computer code to the physical board. The Arduino platform has become quite popular with people just starting with electronics, and for good reason. Unlike most previous programmable circuit boards, the Arduino does not need a separate piece of hardware (called a programmer) to load new code onto the board -- you can simply use a USB cable. Additionally, the Arduino IDE uses a simplified version of C++, making it easier to learn to program. Finally, Arduino provides a standard form factor that breaks out the functions of the micro-controller into a more accessible package.

7

Fig-1: Adruino UNO

3.3.2 Matrix Keypad (4×4):

This 4x4 matrix keypad has 12 built-in pushbutton contacts connected to row and column lines. A microcontroller can scan these lines for a button-pressed state. In the keypad library, the Propeller sets all the column lines to input and all the row lines to input. Then, it picks a row and sets it high. After that, it checks the column lines one at a time. If the column connection stays low, the button on the row has not been pressed. If it goes high, the microcontroller knows which row (the one it set high), and which column, (the one that was detected high when checked).

Fig-2: 4×3 Matrix Keypad

3.3.3 LCD Display (16×2):

An LCD (Liquid Crystal Display) screen is an electronic display module and has a wide range of applications. A 16x2 LCD is a very basic module and is very commonly used in various devices and circuits. A 16x2 LCD means it can display 16 characters per line and there are 2 such lines. In this LCD each character is displayed in a 5x7 pixel matrix. The 16 x 2 intelligent alphanumeric dot matrix display is capable of displaying 224

Fig-3: 16x2 LCD Display

different characters and symbols. This LCD has two registers, namely, Command and Data.

3.3.4 Servo Motor:

This A servo motor is a rotational or translational motor that receives power from a servo amplifier and is used to impart torque or force to a mechanical device like an actuator or a brake. Servo motors provide exact angular position, acceleration, and velocity control. A closed-loop control system is used with this type of motor. A closed-loop control system takes the current output into account and adjusts it to the desired state. The output of the motor drives the control action in these systems. The velocity and final position of the shaft is controlled by a positive feedback mechanism. In these motors, there are two forms of current flow: AC and DC. AC servo motors are more typically found in heavy industrial machines because they can sustain higher current surges. DC Servo Motors from ISL are best suited for compact applications and provide great control and feedback. The frequency of the applied voltage and the number of magnetic poles affect the speed of a servo motor.

Fig-4: Servo Motor

3.4 Implementation:

At first, the Keypad-Pad component was connected with the Arduino UNO R3. We connected all the necessary pins of the Keypad to the Arduino board. All 8 pins were connected using connecting wires.

Fig-5: Keypad connected with Arduino Board

Then we connected the 16x2 Alphanumeric Display to the Arduino Board. This allowed us to view the inserted values and messages. All the pins were connected using connecting wires.

Fig-6: 16x2 Alphanumeric Display connected with Arduino board

Finally, we connected the PWM Powered Servo Motor with the Arduino Board. The motor is used to open and close the locking mechanism of the door. If the Motor rotates 90°, then the lock will open. If it stays in the same position, the lock will stay closed.

Fig-7: Servo Motor connected with Arduino Boards

3.5 Test Experimental Setup:

We implement our Test Experimental Setup on Proteus Design Suite; A virtual electronic design automation software. For generating the source code for Arduino UNO official IDE of Arduino is used. We export .hex file from the IDE after successful code compilation and import it in proteus to start the simulation.

Fig-8: Complete Circuit Diagram

3.6 Source Code:

```
#include <Keypad.h>
#include <LiquidCrystal.h>
#include <Servo.h>

#define Password_Length 5

Servo myservo;

Fig-11: On Giving The Correct Password

Fig-12: Timeout After Entering

Fig-13: On Giving The Wrong Password

Chapter – 4 (Conclusion)

Thus **“DIGITAL KEYPAD SECURITY DOOR LOCK”** is a modern successor of the conventional door locking system. The conclusion of the discussion of smart Lock using Arduino is the innovation created from the lock system with no more direct contact between the user and the lock. This system is very cost-effective and easy to install. In conclusion, it was discovered that the project performed according to specification and can be implemented. The use of the Arduino UNO microcontroller in this project allows for design simplicity, hence, the project can be achieved in lesser time compared to other techniques previously employed.

This work proposes a secure locking/unlocking system based on a keypad and Arduino. Adding password to the Arduino side increase the system security. The system also has a feature for locking itself after some delayed time. This system could be used to prevent houses, companies, institutions from stealing or losing the ordinary key.
